

ELECTRIC SCHOOL BUSES

Here's why they are a better choice

Cleaner air

Diesel exhaust is linked to increased risk of allergies, asthma, cancer and more - and pollutant levels are even higher inside buses, putting kids at risk. Electric buses don't emit toxic exhaust. That means cleaner air for kids and communities.

Lower carbon emissions

Electric school buses are zero emission vehicles - and each one emits 17 to 23 tonnes less carbon dioxide per year than a diesel bus. Electrifying bus fleets will help us meet our climate targets.

Quieter ride

Electric motors are very quiet. Kids can socialize or read on the way to school, and it's more pleasant for drivers too.

Demonstrates action

Switching to electric school buses shows kids that adults are serious about climate action, and is an opportunity for kids to learn about exciting low carbon technologies.

More economical

With 80% lower running costs and 60% lower maintenance costs compared to diesel buses, electric buses are more economical.
