Raytheon Technologies is building the replacement system for the AGM-86 air-launched cruise missile (ALCM) which had previously been built by Boeing for the B-52H Stratofortress bomber.

Raytheon subsidiary Collins Aerospace is building the secondary launch platform for the new U.S. Ground Based Strategic Deterrent which is also supposed to integrate with the existing Minuteman III system.

Raytheon also does the logistic support, installation, and sustainment of Minuteman MEECN (Minimum Essential Emergency Communication Network) programme and the Minuteman MEECN programme upgrade.

Raytheon earns at least $409 million per year from nuclear weapon related contracts. These include a new five year, $2 billion contract issued in 2021 for the Long Range Standoff weapon, and an outstanding 8-year, $73 million contract issued in 2013. Raytheon’s subsidiary is also involved in the Ground Based Strategic Deterrent, but the amount is unclear.
