Sea Level Rise - What we'll discuss today

New Law - SB 272

A **regional** SLR solution that includes Nature based Adaptation

Bay Ecosystems that we need and use everyday

Nature-based solutions we need to work with

Sea Level Rise Projections

Sea Level Rise (SLR) is projected every 5 years by the California Ocean Protection Council

SO WHAT CAN WE DO ABOUT IT

- First instinct - put up an **levee** or concrete sea wall to keep the water out as it rises
- However **living shorelines** are what keeps needed Bay eco-services alive

SB 272

New Law passed last year

- **Governance Gap:** SLR is regional, however there is no regional plan for adapting to SLR. Every city is on its own
- **Enter SB 272** which requires every local government with a bay or coast edge to have a SLR adaptation plan that follows regional guidelines and approved by BCDC or the Coastal Commission. Deadline Jan 1, 2034,

The “Regional Shoreline Adaptation Plan” (RSAP)

BCDC has been entrusted with developing the guidelines for approval in the Bay Area

The bay will be divided into **“Sub-regional”** areas, each with its own guidelines, maps and strategies that are appropriate

The 6 Bay Adapt goals include

- **“Put Nature First when possible**
- **“Support Vulnerable Communities”**

Put Nature First because
Nature's Ecosystems are critical

The Bay quietly and efficiently
provides a slew of ecological
services

Without all its 'free' services
we'd be in serious trouble.

1365173885

Marshes provide Flood Control

Marshes absorb stormwater and hold it.

Marshes prevent waves from reaching the shore and eroding the land or levees

Marshes “grow” higher by trapping sediments and can keep up with sea level rise

A marsh in front of a levee keeps the much levee lower, as no waves can reach it

The Bay Cleans our Stormwater

Storm Water, with lots of pollutants, go into creeks

Creeks empty onto marshes & wetlands in the bay

Marshes trap dirt/sediment, absorb and remove pollutants, fertilizers, pesticides, heavy metals, toxic brake dust, tire dust

Clean Air

Fast-growing marsh plants take CO_2 from the air. Use the carbon to grow and release the oxygen.

Eel grass meadows underwater take in CO_2 and release strings of bubbles of O_2 when the sun is shining! Awesome to watch!

Climate Change - Carbon Capture & Storage

Carbon capture- as marsh plants grow they grab carbon to grow and in their roots

Carbon storage - underwater, dead anaerobic carbon can stay for hundreds of years

Some wetlands **sequester more carbon than tropical rainforests**

Wetlands invaluable for

Fish and wildlife habitat

Chinook Salmon

Including endangered species and species of special concern

So...we need Wetlands & Shallow Water Habitat

- 1.
- 2.
3. Without marshes, the web of life would be gone
4. along with all the ECOSERVICES
5. that the Bay provides us
- 6.
- 7.

Sea Level Rise Solutions

“GREY” INFRASTRUCTURE Can have expensive problems and disrupt or destroy ecosystems

What are Nature-based Adaptation Solutions?

Actions that **harness biodiversity and ecosystem services** to **reduce vulnerability** and **build resilience** to climate change.

Eelgrass

Oysters

Mudflats

Marshes

Ecotone levee
(marsh + levee)

Range from fully natural → Hybrid (natural + engineered)

ADAPTATION ATLAS

By SFEI and SPUR

A good place to start....

Used as a reference by all the agencies for Nature-based solutions unique to each part of the Bay

SAN FRANCISCO BAY SHORELINE **Adaptation Atlas**

Working with Nature to Plan for Sea Level Rise
Using Operational Landscape Units

Nature's Boundaries

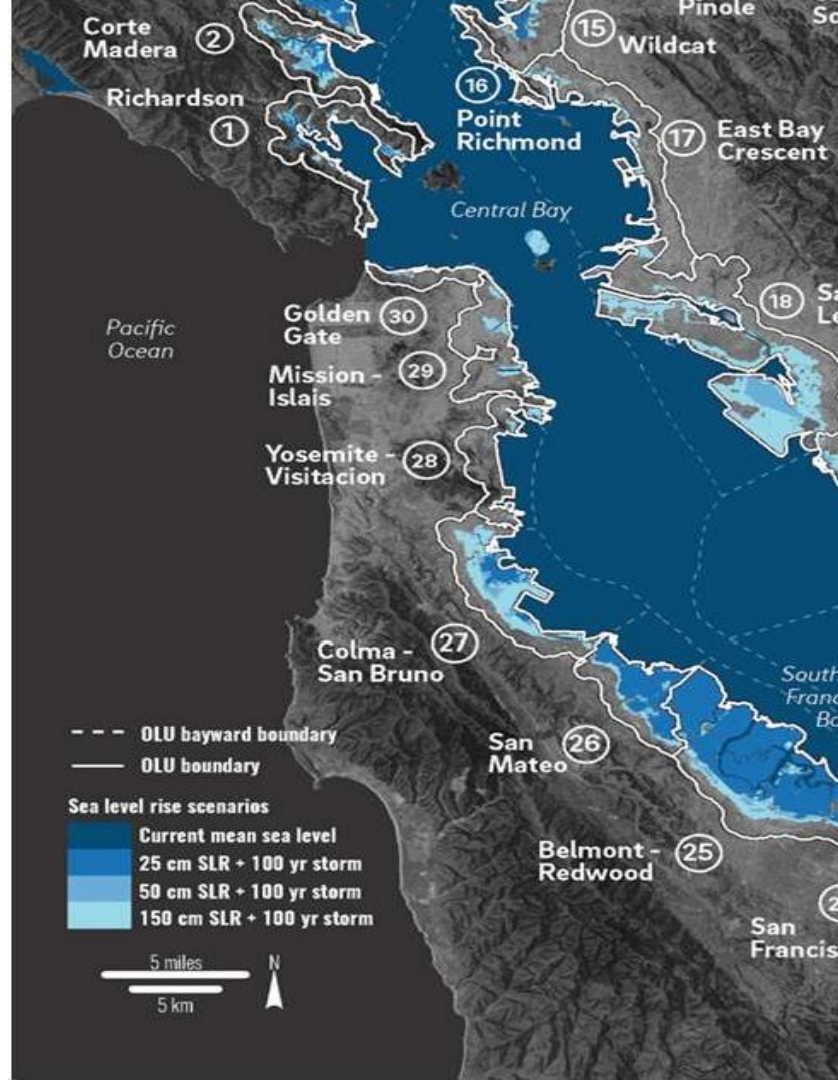

“Operational Landscape Units” (OLU)

Areas with shared geophysical and land use characteristics **suited for a particular suite of nature-based measures**

Describes nature-based strategies for each OLU

Adaptation Atlas

SFEI

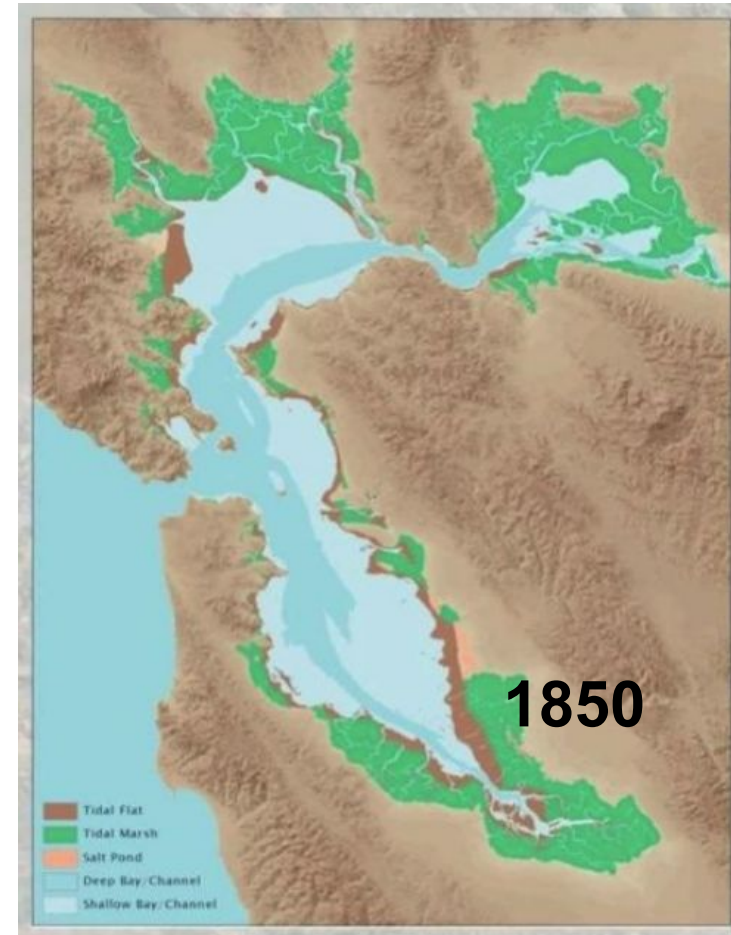

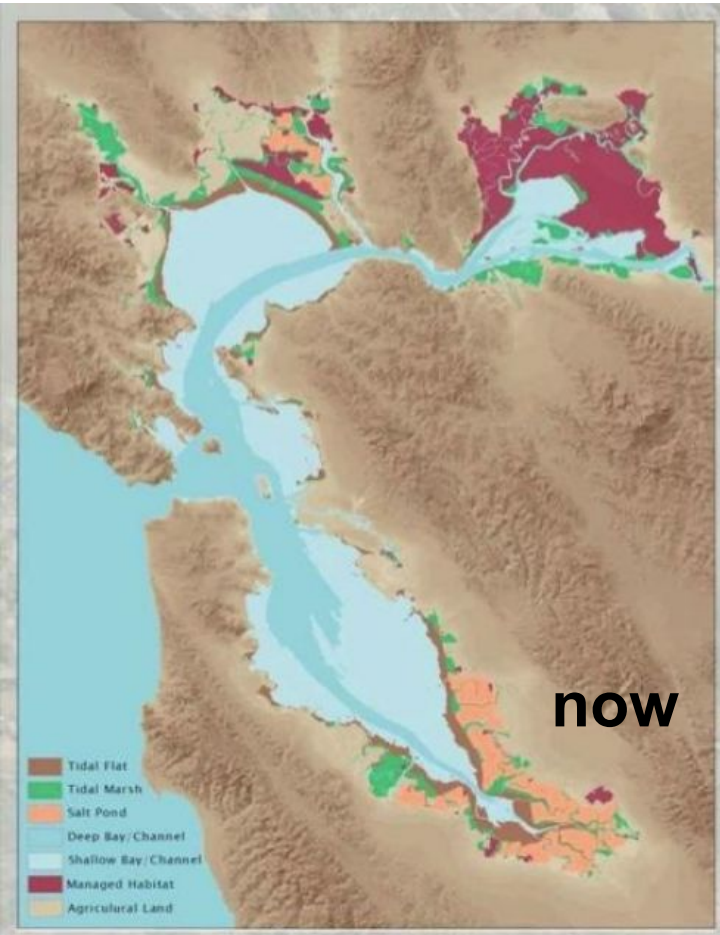

Tidal Wetlands - Mudflats and Marshes

Wetlands are areas where water is present at or near the surface all year or for varying periods, including the growing season

Tidal wetlands are at risk of drowning as sea levels rise

Marshes

95% of the living marshes have been filled in for development as our cities grew

Clean Sewage Water

Storm water -we saw it flows into marshes now and is cleaned

How about Sewage? - After 1972 only treated sewage allowed to go into the Bay. Now those plants are at end of life.

Treated sewage still has Nitrogen & other pollutants..As we grow, this is creating algae blooms and massive die-offs

1972-2022
The Next 50 Years

Starting June 2024 BAWQCB:
By 2034, the 37 wastewater
treatment plants will have to
reduce nitrogen fertilizer and
sewage in their water by 40%
HOW?!

ECOTONE LEVEE removes 99% of pollutants

A very gently sloping vegetated slope on bayside of levee- the treated wastewater flows thru the soil, plant roots remove pollutants, levee can be low because marsh blocks waves

A new kind of levee

The Bay Institute, an environmental group, has proposed a number of "horizontal levees" for San Francisco Bay that blend a traditional earthen levee with restored tidal marshes. The marshes would be built up with sediment from local flood control channels. Marsh vegetation would be irrigated with reclaimed wastewater.

Marshes as barriers

Tidal marshes can slow down storm surges, meaning levees fronted by marshes can be built half as tall, and at half the cost, as traditional levees made of earth and clay.

Use Ecotone Levees

to protect waste
treatment plants
from SLR

**Removes 99%
nitrogen and
other pollutants**

Redwood Shores

Flood Mitigation with Eelgrass Meadows

**Eelgrass Meadows break up wave action, protect shorelines
And are nurseries for a rich biodiversity of water creatures**

Eelgrass meadows

OYSTER REEFS WERE PROLIFIC IN THE BAY - REEFS protect against erosion

San Rafael Living Shoreline Project Over two million native oysters and eel grass have grown on Coastal Conservancy's Living Shoreline Reefs constructed in 2012

Oysters have tremendous ecological value! Each can filter 50 gallons of water a day clarifying and cleaning the water in the Bay

Aramburu Island, Marin
Augmenting a beach for
erosion control

Beaches

Break wave
action

SLR and Pollution Risk to Communities and the Bay

Rising seas and rising groundwater will inundate contaminated sites

Toxic Tides: UC Berkeley and UCLA analyzed how SLR will impact contaminated sites

These toxic sites are disproportionately located near vulnerable communities burdened by environmental injustice

Change our thinking?

Think about being able to **eat the food from the bay** and a lot of nature based solutions fall in place.

Rather than trying to **fight nature** to stop the water

Wouldn't an Annual Oyster Festival at South City Oyster Point be great!

FUNDING and FEMA are working hard to keep up

- Agencies are retooling for new realization. We can't engineer our way out of this without **paying unbearable costs**

The real costs:

- Lose flood mitigation with drowned living marshes and ecosystems
- Lose clean water - need to treat storm and sewer water with chemicals,
- Lose fresh bay air - lose oxygen, fresh breezes, cool weather
- Lose carbon capture -accelerate climate change instead of slowing it
- Lose Habitat -creates Biodiversity collapse
- Our health, vulnerable communities all pay the costs

We really need to keep the Bay Alive and make it healthier!

Thank You!

Sea Level Rise Webinar

May 2021

Day 1

What is Nature-Based Adaptation? Panel One

John Bourgeois
Valley Water

Julie Beagle
US Army Corps of
Engineers

Julian Wood
Point Blue
Conservation Science

What is Nature-Based Adaptation? Panel Two

Patricia Oikawa
California State

Management Agency

Nature-based Adaptation vs “Grey” Infrastructure

- Tidal marshes restore/migrate
 - Mudflat augmentation
 - Submerged aquatic eelgrass
 - Nearshore oyster reefs
 - Rough Beaches
 - Ecotone levees /clean waste and habitat migration space
 - Creek-to-baylands connection
 - Migration space for marshes
 - Green stormwater infrastructure
 - Existing ponds management
- Elevate the whole land
 - Flood walls
 - Seawalls
 - Bulkheads
 - Riprap or armoring shore
 - Levees
 - Levees with seawalls
 - Elevate transportation
